qwertyApp

Electron applications needs nodejs and npm to run in development stage. When applications have been build it does not have any dependency.

To Use

```
# Go into the repository
cd qwertyApp
# Install dependencies
npm install
# Run the app
npm start
```

To Build

```
# Go into the repository
cd qwertyApp
# Install electron-packager
npm install electron-packager -g
# Build the app
npm electron-packager .
```

Directory Informations

/.

- `package.json` - Points to the app's main file and lists its details and dependencies.
- `main.js` - Starts the app and creates a browser window to render HTML. This is the app's main process.
- `index.html` - A web page to render. This is the app's renderer process.

/views

- `HTML codes of each application page

/src

- `Source code of project with designed classes

/css

- `CSS files for styling
